

CALUMET COUNTY GROUNDWATER REPORT

CREATED BY THE LAND AND WATER CONSERVATION DEPARTMENT

JULY 2018

Groundwater is a valuable resource to Calumet County residents. Most residents, businesses, and municipalities rely on groundwater for drinking water and other uses. The Calumet County Land and Water Conservation Department (LWCD) has administered a private well testing program for over 15 years, educating private well owners on the importance of testing wells on a regular basis for contaminants. Well owners are recommended to sample their drinking water for coliform bacteria and nitrate every 12-15 months, more frequently if problems are found. To encourage testing, the LWCD holds a group testing event once a year, and maintains a supply of testing kits in the LWCD office year round for greater access. The following report provides information on the 2018 annual group testing program, as well as cumulative results of participating wells since 2005.

ANNUAL GROUP TESTING PROGRAM

In 2018, the LWCD targeted private well owners in the Village of Potter, and the Towns of Rantoul, New Holstein and Chilton through a group testing program. Additional residents on the County Groundwater mailing list were also included. 200 registered for the event. On May 7th of this year, 188 samples were collected by residents. All samples were analyzed for coliform bacteria and nitrate. Seventy-three samples were analyzed for a metals package, and 42 samples were analyzed for triazines – atrazine and other pesticides. Fifty-nine wells were new to the County Testing Program, while the remaining wells had participated during the past 15 years. Below are the results of the testing event. Samples pulled from treatment systems (such as a reverse osmosis or R.O. system) were not included in the data analysis.

	Chilton # (percent)	New Holstein # (percent)	Rantoul # (percent)	Potter # (percent)	County # (percent)
Number of Wells	N = 69	N = 47	N = 30	N = 11	N = 185
Coliform Bacteria Positive	17 (24.6%)	7 (14.9%)	6 (20%)	1 (9.1%)	41 (22.1%)
E. coli	8 (12%)	1 (2.1%)	0 (0%)	0 (0%)	12 (6.4%)
Nitrate >10 mg/L	16 (23.1%)	7 (14.9%)	0 (0%)	0 (0%)	24 (12.9%)
Nitrate >2 mg/L	47 (68.1%)	23 (48.9%)	5 (16.6%)	4 (36.4%)	89 (48.1%)
Bacteria Present AND/OR Nitrate >10mg/L	28 (40.6%)	14 (29.7%)	6 (20%)	1 (9.1%)	60 (32%)

WHAT HAPPENS WITH A BACTERIA POSITIVE RESULT?

The Water & Environmental Analysis Lab (WEAL) notifies all well owners with safe drinking water exceedances (bacteria positive and/or >10mg/L Nitrate) via postcard within 1 week of the sampling date. Postcards encourage well owners to contact the LWCD for retest kits (bacteria) or further information. LWCD staff call all E.coli positive homeowners, with instructions to chlorinate the well and follow up within 3 weeks of chlorination. For bacteria positive wells, homeowners are asked a series of questions about well condition to try to identify potential source(s) of contamination.

The test for total coliform bacteria is sensitive to many different coliform bacteria, including fecal coliforms. Most non-fecal coliforms are not a public health concern, but rather are an indicator that a well is susceptible to contamination from local sources or neighboring land use practices. With a few exceptions, private well owners are not required to take corrective action. A well owner is encouraged to do one or more of the following:

- Perform a retest to ensure the result was not a false-positive result due to sampling error. A recent analysis of the County Infant Well Testing Program indicates a false-positive rate of 8%.
- Chlorinate the well. Instructions are made available to well owners to disinfect the well and/or contact a professional to provide this service.
- Perform a well inspection.
 - Is there a vermin-proof cap? Is the conduit cracked?
 - Are there landscaping features or structures around the well that would invite wildlife to nest near the well?
 - Is the area around the well graded to keep standing water away?
 - Does the well terminate at least 12" from grade?
 - Are there any contamination sources close to the well or downspouts directed toward the well?
 - Is the well meeting state codes? Contact a well professional to inspect casing and well. Consider upgrading or replacing dug wells or pit wells.
- Is the private onsite waste treatment system (POWTS) functioning properly? Date of last inspection?
- Is there another unused or old well located on the property?

Some local (on-site) contamination sources discovered through phone conversations or site inspections in Calumet County:

- Well surrounded by a "wishing well" lawn ornament.
- Chickens housed in the well house.
- Bird bath kept on top of covered pit well.
- No vermin proof cap.

WHAT HAPPENS WHEN NITRATE EXCEEDANCE OCCURS?

Private well owners with nitrate exceeding 10mg/L are informed via postcards of the unsafe levels within 1 week of the sampling date and are encouraged to contact the LWCD for more information. Short-term exposure to high nitrate levels are a concern for pregnant women, women who are trying to become pregnant, infants under 6 months of age, and others with compromised immune systems. Additional quarterly testing is recommended to help determine if the nitrate levels are chronically high. It is recommended that all well owners reduce or eliminate long-term consumption (years). Well owners are encouraged to make sure their well is properly maintained, following the same guidelines and questions for bacteria positive wells above.

Nitrate in groundwater tends to persist overtime, but can be treated with a point of use system such as a reverse osmosis system or a distillation system. These systems do not treat whole-house water supply, but rather are limited to the drinking water faucet. A homeowner is encouraged to make sure the device installed is certified by Wisconsin Dept. of Safety and Professional Services and test the device for efficiency if nitrate exceeds 15 mg/L. Similar to total coliform bacteria, nitrate is used as an indicator to determine if the well is susceptible to contamination from local sources or neighboring land use practices.

GROUNDWATER EDUCATION NIGHT

On June 20, 2018 participants were invited to a one hour educational meeting where they may obtain the full lab report, including metals results, and instructions on how to interpret the lab information. Calumet County staff and UW-Extension staff are available throughout the evening to answer questions that well owners may have. This event is always well attended, with 54 people in attendance in 2018 (42 wells). This event was also open to the public.

COUNTY-WIDE PRIVATE WELL DATA 2004-2018

Beyond the annual group testing program, the department receives test results from additional sources including the following:

- Year-round voluntary private well testing.
- County Land Division Ordinance (Bacteria, Nitrate, Arsenic).
- County Health Department; Infant Wellness Program (Bacteria, Nitrate, Metals, and more).
- County LWCD funding for investigating spills or brown water events.
- Occasional research or DNR investigations.

Figure (1): Annual test results from private well samples in Calumet County. Cumulative Data (in yellow) represents the most recent sample from each participating well.

Private Well Test Results County-Wide 2005-2018										
7/5/2018	Coliform Bacteria					Nitrates			Bacteria Present and/or Nitrate > 10 mg/L (%)	
	# wells	Coliform Bacteria Positive	% Positive	E. coli Positive (%)	% E.coli	# wells	Nitrate > 10 mg/L	% Unsafe Wells (≥ 10 mg/L)	Unsafe (Bacteria present AND Nitrates)	%

2018	213	48	23%	18	8%	192	25	13%	68	31.9%
Cummulative Data*	1539	328	21.3%	54	3.5%	1452	239	16.5%	497	32%

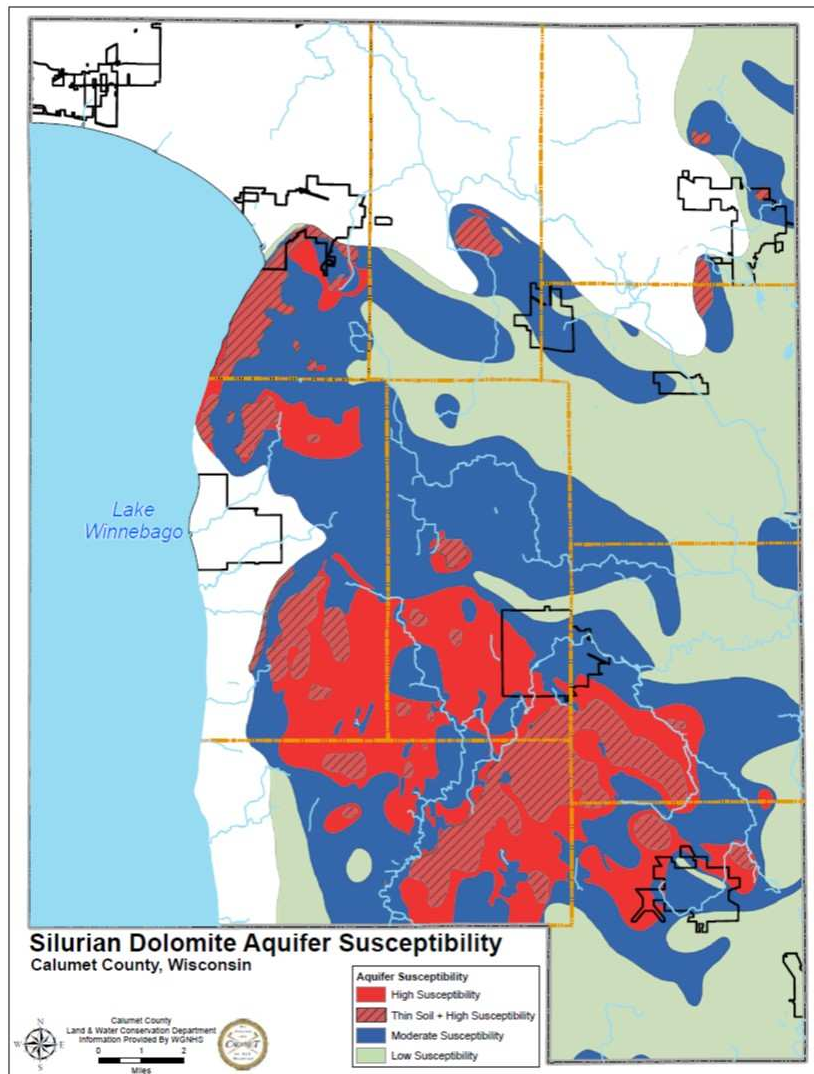

* Wells in the Calumet County Test Program may be sampled multiple years or more than once in a year. These data represent the most recent sample from each participating well.

As of June 30, 2018, the county received results from an additional 28 wells in 2018, for a total of 213 samples. **Figure (1)** depicts the county private well data by year for coliform bacteria and nitrate. Cumulative data represents the latest sample for each participating well in the Calumet County program.

Several wells in the Klotten area reported brown water during spring thaw events in early 2018. County staff provided free test kits to homeowners in the affected area. Eight samples from 5 wells were positive for E.coli. The last significant brown water event occurred in 2014. An additional 10 wells tested positive for E.coli in the May group testing event. Portions of the targeted area received

significant rain four days prior to the sample event. The increase in E.coli contamination may be attributed to these two recharge events.

WATER QUALITY IN KARST AREAS OF CALUMET COUNTY

There are areas in the county that are more susceptible to groundwater contamination. These areas are delineated on the Silurian Dolomite Aquifer Susceptibility Map (**Figure (2)**): red and blue layers of the map). These areas are defined as moderately to highly susceptible to contamination due to proximity of bedrock to the surface, presence of karst features characteristic of the dolomite (limestone) aquifer, and/or thin soils.

Attached to this report are maps displaying the geographical distribution of the nitrate and total coliform bacteria results from 2018. The localized nitrate contamination in the southern half of Town of Chilton and portions of New Holstein is well documented, including the southern portion of New Holstein near Kiel where the soil tends to consist of more

sand/silt loam than in other areas of the county. E.coli positive wells were also located in the areas where bedrock can be near the surface (0-50 feet).

Well testing data indicate that contamination percentages increase in karst areas of Calumet County; 40% of wells tested unsafe for bacteria and/or nitrate in 2018 (**Figure (3)**), compared to 32% county-wide. Kewaunee County well data suggests that approximately 29% of wells (county-wide) exceed the safe drinking water standard for either coliform bacteria and/or nitrate (Kewaunee County, 2016). Calumet County cumulative data suggests that 43% of wells exceed the safe drinking water standards in Karst areas.

Figure (3): Annual test results from private well samples in Karst Areas of Calumet County. Cumulative Data (in yellow) represents the most recent sample from each participating well.

Private Well Test Results in Karst Areas 2005-2018										
7/5/2018	Coliform Bacteria					Nitrates			Bacteria Present and/or Nitrate ≥ 10 mg/L (%)	Bacteria Present and/or Nitrate ≥ 10 mg/L
	# wells	Coliform Bacteria Positive	% Positive	E. coli Positive	% E.coli	# wells	Nitrate ≥ 10 mg/L	% Unsafe Wells (≥ 10 mg/L)	Number	%

* Wells in the Calumet County Test Program may be sampled multiple years or more than once in a year. These data represent the most recent sample from each participating well.

METALS AND PESTICIDES

Seventy-three well owners elected to perform the optional metals package, which analyzes for 11 different metals (*arsenic, calcium, copper, iron, lead, magnesium, manganese, potassium, sodium, sulfate, and zinc*). Some metals cause problems that are considered aesthetic in nature, including sulfate, iron and sodium, while others are associated with health related risks, such as arsenic, lead and copper. Wells in the northern part of the county and along the L. Winnebago shoreline typically rely on the lower St. Peter Sandstone Aquifer, and are well known for having very hard water with a strong sulfur smell. Wells routinely test high for sulfate, sodium, hardness, and other inorganics in this aquifer, and some excessively exceed aesthetic limits. This can make it very challenging for a well owner to treat water enough to remove these aesthetic problems.

Arsenic is found in some county wells and levels occasionally exceed the safe drinking water standard of 10 parts per billion (ppb). However, most wells that do exceed safe drinking limits are rarely above 20 ppb, much lower than results in neighboring counties where wells test over 100 ppb (Outagamie, Winnebago). Well owners are encouraged to test for arsenic at least once. If found elevated, it is recommended to sample every 3-5 years to monitor for rising levels. Arsenic levels may increase with declining water tables. A treatment system may be installed at the drinking water faucet to correct for high levels of arsenic.

Copper and lead are found in some homes in Calumet County. The presence of copper and lead is not related to geology or geographic distribution. The source of these two metals is primarily plumbing in the home. If levels exceed the safe drinking water standard, homeowners are encouraged to run the water a few minutes prior to drinking to flush out water that was in contact with the plumbing for an extended period of time.

Forty-two wells performed the DACT screen which tests for triazines, a class of pesticides that include atrazine, simazine and cyanazine. Four wells detected levels of triazines, but no samples exceeded the safe drinking water standard set at 3.0 parts per billion. For more information on the DACT screen, please see the brochure provided with this report.

ANNUAL TESTING RECOMMENDATIONS

Private well owners are responsible for maintaining and testing their local drinking water supply. It is important to understand the quality of a private drinking water supply by testing on an annual basis for bacteria and nitrates - at a minimum. The programs offered by Calumet County are voluntary and well owners are not required to take corrective action if a problem is discovered. Recommendations are provided based on well test results, location in the County, and general water quality in the area. On occasion, staff will conduct site visits upon request. Bottles are available year-round in the LWCD office, Room 227 of the Calumet County Courthouse.

In an effort to encourage private well owners to test their wells, the Calumet County LWCD offers an annual group testing program. The program targets two towns (or village) annually, rotating between 7 of the 8 municipalities in the county on a four year rotation. The Town of Chilton tests annually.

Benefits of the program include bottle pick up & drop off convenience, free shipping and an education night held approximately 5 weeks after the sampling day. The education night is an opportunity to learn how to interpret results and options to resolve any problems with water quality, including plumbing, proper well maintenance and at home-practices to improve your drinking water.
